

A 1-to-2 optical splitter will reduce internet speed

Overview

The quality and capacity of a splitter can significantly impact the performance of your internet connection. A splitter is a small device that divides a single input signal into multiple outputs. By dividing a single optical signal from a central Optical Line Terminal (OLT) into multiple outputs for Optical Network Terminals (ONTs) at users' homes, splitters eliminate the need for dedicated fibers to each residence—slashing infrastructure costs while scaling network reach. An Optical Splitter (also known as a fiber optic splitter or beam splitter) is a passive optical power management device.

A 1-to-2 optical splitter will reduce internet speed

Fiber Optic Splitter 1×2: A Smart Choice for Precise

In today's high-speed optical networks, precise and efficient signal distribution is fundamental. Among the most compact yet essential components in
