

ADSS optical cables have the characteristics of thermal shrinkage and thermal expansion

Overview

The elastic modulus of the aramid rope is more than half that of steel, and the coefficient of thermal expansion is a fraction of that of steel, which determines the arc of the ADSS optical cable. ADSS (All-Dielectric Self-Supporting) fiber optic cables are specifically produced for elevated applications in electric power transmission and distribution. They are adopted widely because they are made of fully dielectrics, are relatively lightweight, and can be installed even without conducting.

ADSS optical cables have the characteristics of thermal shrinkage a

Detailed Introduction and Selection Guide for----ADSS Optical Fiber Cable

For fiber counts exceeding 144 fibers, a fiber ribbon-based ADSS structure is generally recommended to reduce the cable diameter, thereby lowering production costs and facilitating installation and routing.
