

Automatic inventory check of optical splitter resources

Overview

The invention discloses a system and a method for automatically detecting the accuracy of optical splitter resources based on digital twin and AI, wherein the system comprises the following steps: a digital twin module: carrying out digital twin modeling on the optical. The ODN/ORP visualization service manages dumb resources on enterprise optical networks. This chapter describes the positioning, benefits, application scenarios, devices, and. The S120 network verifier has a port release function, which can effectively remove virtual occupied line ports, and can test: Online: indicates that the subscriber line is in normal use. Offline: It indicates that the optical fiber of the user is connected to the optical modem, but the optical. A fiber broadband provider typically determines and overall split ratio for the network, such as 1x32 or 1x64, and uses combinations of splitters to meet that ratio with each PON port. The Asia Pacific region (APAC) leads worldwide consumption of Planar Lightwave Circuit (PLC) splitter compact devices with a 68% share, followed by the Americas and the EMEA (Europe, Middle East, and Africa) region.

Automatic inventory check of optical splitter resources

Optimization of inventory management through computer vision and

Integrating machine learning and computer vision technologies, this solution addresses critical challenges in inventory accuracy and operational efficiency, overcoming the limitations of
