

# C51 Relay Protection

## Overview

---

In protective relay-based systems, the time overcurrent protection function is designated by the ANSI/IEEE number code 51. The Type 49/50/51 overload relay provides three important functions for the protection of a motor. The Type 49/50/51 overload relay provides three important functions for the protection of a motor: Overload Protection (Function 49), Locked Rotor Protection (Function 51) and Phase Fault Protection. Protection relays are essential for ensuring electrical system safety and reliability. The DIAC, DIFC and DSFC line of digital single phase, self-powered relays offers customers a single relay that replaces the hundreds of different models of IAC, IFC and SFC relays.
