

Don't ask where fiber optic cables come from

Overview

Optical fiber consists of a core and a cladding layer, selected for due to the difference in the refractive index between the two. This coating protects the fiber from damage but does not contribute to its properties. Fiber optic cables originate from a worldwide network of raw material suppliers, manufacturers, and distributors. A fiber-optic cable, also known as an optical-fiber cable, is an assembly similar to an electrical cable but containing one or more optical fibers that are used to carry light. Fibre optic cables are a type of network cable for transmitting data in the form of light, as mentioned above, and consist of a central core surrounded by protective layers to guide the light without significant signal loss.

Don't ask where fiber optic cables come from

How does a fiber optic cable work?

Over the last 20 years or so, fiber optic lines have taken over and transformed the long distance telephone industry. Optical fibers are also a huge part of making

What materials are fiber optic cables made of

At the core of every fiber optic cable is an incredibly thin strand of pure glass or plastic known as the optical fiber. This is where the magic happens - the core is designed to carry light

OverviewDesignPerformanceCable typesColor codingHybrid cablesInnerductsSee also

Optical fiber consists of a core and a cladding layer, selected for total internal reflection due to the difference in the refractive index between the two. In practical fibers, the cladding is usually coated with a layer of acrylate polymer or polyimide. This coating protects the fiber from damage but does not contribute to its optical waveguide properties. Individual coated fibers (or fibers formed into ribbons or bundles) then ha
