

# **Fiber optic splice loss reduced to 0.16**

## Overview

---

16 dB per splice), mechanically strong splices to be achieved which are found to introduce negligible intermodal crosstalk and allow single mode transmission without any significant BER penalty. This guide reveals the secrets to fusion splicing with little fluff—just proven, straightforward techniques refined from years of work in the field. Sometimes the power budget has both a minimum and maximum value, which means it needs at least a minimum value of loss so that it does not. Modal content is negligibly affected by splicing, enabling penalty-free 40Gbit/s data transmission over > 200m of spliced PBGF.

## How to reduce fiber splice loss?

As we all know, after the optical fiber is spliced, a certain amount of loss will be generated when the light is transmitted to the joint, and this is called the splice loss or splice loss. So, how to
