

How to use the OTDR test module s 1m event blind zone

Overview

OTDR settings are a balance between dynamic range, acquisition time, spatial resolution and accuracy. Testing multimode fiber cabling in high density environments requires a specialized OTDR capable of testing closely spaced connectors. As a result, testing with an OTDR becomes difficult for all but the OTDRs with the. Dead zones occur when reflections from events close to the OTDR are not fully resolved, leading to inaccurate distance measurements. The optical eye test mode represents each event point on the link in the form of visual icons, which makes it easy for operators to understand.
