

Is FC a mechanical hard drive interface

Overview

Fibre Channel hard disk drives (FC HDDs) are a type of server hard drive that uses the Fibre Channel interface to communicate with the host server. Hard disk drives are accessed over one of a number of bus types, including parallel ATA (PATA, also called IDE or EIDE; described before the introduction of SATA as ATA), Serial ATA (SATA), SCSI, Serial Attached SCSI (SAS), and Fibre Channel. An internal hard disk drive is one of the most vital components of a computer's hardware. But, unfortunately, it cannot be entirely protected from logical failures and human errors. Fibre Channel is a high-speed network that is designed for data storage, and it offers much better performance than the SATA or SAS interfaces that are. It controls how data is transferred, how commands are executed, and how power is delivered.
