

Low Current Grounding Detection Device 4-Section Busbar

Overview

The ZJJ - 4SA DC insulation relay adopts a fully static circuit, and has a highly sensitive grounding resistance monitoring and display circuit, which helps users make a quantitative assessment of the reduction of the insulation degree of the DC busbar, and monitors the grounding. Low-voltage (LV) sensors, with their growing maturity, can now monitor multiple points of the mid-voltage (MV) distribution network. This paper proposes a new method for identifying single-phase-to-ground line faults and locating them using LV sensors deployed on the LV side of distribution. ABB busbar systems enable safe and easy cross-wiring of miniature circuit breakers, residual current devices and other Modular DIN-Rail products. The following points should be considered when selecting the correct busbars: REG terminal type (twin terminal or cage terminal), number of poles, device. Busbar protection (BBP): Protection intended to detect and operate to clear faults on a busbar.

Low Current Grounding Detection Device 4-Section Busbar

Novel busbar protection scheme for impedance-earthed distribution

The proposed scheme successfully detects single-phase-to-ground busbar faults by using the standard settings of the widely available overcurrent IEDs, and an IEC 61850 communication
