

# **Plastic distribution boxes are prone to overheating**

## Overview

---

(1) Choose distribution boxes with louvered vents on both sides and an incomplete internal partition to facilitate air convection for heat dissipation.

(2) The box body should preferably be made of natural-color stainless steel, which is less prone to corrosion and. High-temperature environments (above 60°C) easily accelerate plastic aging and poor terminal contact. When they start tripping, overheating, or making strange noises, it's more than just an inconvenience - it's your home's cry for help. The enclosure serves a critical dual purpose in every modern power network globally. Problems caused by the influence of ambient temperature on low voltage electrical appliances The low voltage apparatus in the distribution box is composed of fuse, communication contactor, residual current operated protector, capacitor and metering meter.
