

Principle of Fiber Optic Adjustable Attenuator

Overview

A fiber optic attenuator reduces optical signal energy through absorption, reflection, or scattering. Its core functions include:

- **Power Adjustment:** Controlling optical power within the optimal operating range of receiving equipment (typically 1-30dB) to avoid overload or weak. Usually, such attenuators either have a housing equipped with some type of fiber connectors (e. Since too much light may saturate the fibre optic receiver, optical attenuators are often deployed in the system to reduce the light power and achieve the best fibre.
