

Romanian Internet Data Center Project

Overview

Citing Knight Frank data, the Ziarul Financiar reports two new data centers totaling 40-45MW are set to be built in Romania. Romania's central-eastern European location offers rapid connectivity to both Western and Central Europe, making it ideal for latency-sensitive and multi-region redundant deployments. Land, construction, and labor costs remain significantly lower than in the Nordics, Netherlands, or Ireland. In the South-Muntenia region of Romania, a new data centre will consolidate hundreds of fragmented government IT systems, boost digital security and improve services for nearly 300,000 people. The plan is structured around six pillars: the green transition, digital transformation, smart growth, social and territorial cohesion, health and resilience, and policies for the next generation. Two new data centers with a cumulative power of 40-45 MW are considered by developers to be built in Romania, meaning total investments of almost EUR 500 million, according to data from real estate consulting company Knight Frank, quoted by Ziarul Financiar. The Romania Data Center Market Report is Segmented by Hotspot (Bucharest, Cluj-Napoca, Rest of Romania), Data Center Size (Small, Medium, Large, Mega, Massive), Tier Type (Tier I and II, Tier III, Tier IV), and Absorption (Non-Utilised, Utilised).
