

Standards for Testing Headboards

Overview

BS 5852 is a fire test method developed by the British Standards Institution (BSI) that assesses the ignitability and flame spread characteristics of upholstered furniture and related materials. Whether a headboard must meet the upholstery standard or the wall lining standard depends on how it is constructed and installed, and on the interpretation of the fire officer or building control officer responsible for the project. This Technical Information Sheet defines the requirements for headboards on trailers used to transport British Steel products. They can form an integral part of a load restraint system if the product is blocked directly against them. Comprehensive online training content that boosts employee safety and business success.
