

# Style of a three-level distribution box

## Overview

---

Three level distribution box: a distribution box is set under the main distribution box, a switch box is set under the distribution box, and electrical equipment is set under the switch box to form a three-level distribution box. In a newly constructed residential area, a 10kV power line is introduced into the substation. The complete set of products can form a complete three-level protection system for construction electricity, achieving the goal of one machine, one switch, and one protection, which is very suitable for various standard engineering applications. Many feeders leave substation in a concrete ducts and are routed to a nearby pole. These boxes feature bottom entry and exit cables, front-opening doors, and main busbars connected with copper strips for optimal contact. We'll chat about what each one does, where it shines, and then dive into how to choose the perfect box for your needs.
