

# **The function of optical splitters in power grid cables**

## Overview

---

A fiber-optic splitter, also known as a, is based on a of an integrated waveguide power distribution device, similar to a The system uses an optical signal coupled to the branch distribution. It is an optical fiber tandem device with many input and output terminals, especially applicable to a passive optical network (,, The primary function of an optical splitter is to split the light power from an input fiber optic cable into multiple output fibers, each carrying a portion of the original signal. Where splitters are placed in the network can make significant impacts on fiber counts, network cost and deployment time and operational steps, such as customer onboarding and maintenance. One important note is that splitting architectures should be seen as tools that can be mixed and matched to. Its primary role is in Passive Optical Networks (PON), which are the foundation of.

### Design and optimization of optical power splitters for optical access

The main challenges in the design of Y-branch optical splitters are the asymmetric split-ting ratio, (non-uniformity of splitting power), and the large size of the splitter structure. These parameters define the
