

What are the optical coupler chips

Overview

Fiber optic couplers are optical devices that connect three or more fiber ends, dividing one input between two or more outputs, or combining two or more inputs into one output. Optical interconnects is an important issue in silicon photonic integrated circuits for transmitting light, and fiber-to-chip optical interconnects is vital in application scenarios such as data centers and optical transmission systems. To leverage the benefits of fiber optics at the chip level, light traveling in fibers needs to be efficiently coupled in and out of chips.
